The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dr primer containing a Not I site. Double stranded cDNA was ligated to an ECOR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CCATTAAGTG. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI).

//dep_host="Digner | Left Pethvis; Vector: The library was
following tissue(s): Chondrosarcoma. The library was
constructed according to Bonaldo, Lennon and Soares,
Genome Research, 6:791-806, 1996. First strand cDNA
synthesis was primed with an oilgo-dry primer containing a
Not I site. Double stranded cDNA was ligated to an ECOR I
adaptor, digested with Not I, and cloned directionally
into pT7T3-Pac vector: The oilgonucleotide used to prime
the synthesis of first-strand cDNA contains a library tag
sequence that is located between the Not I site and the
//dep_located library is

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 321, Application US/09404879A

Patent No. 6468546

GENERAL INFORMATION:
APPLICANT: Mitcham, Jennifer L.
APPLICANT: Algate, Paul A.
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY AND TITLE OF INVENTION: DIAGNOSIS OF OVARIAN CANCER.
FILE REFERENCE: 210121.462C2
CURRENT APPLICATION UNMBER: US/09/404,879A

CURRENT FILING DATE: 1999-02-24
NUMBER OF SEQ ID NOS: 393
SOFTWARE: FastsEQ for Windows Version 3.0

LENGTH: 690
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 TGGGCTGTGGGCGGCACCTGTGCTCTGCAGGCCAGACAGCGATAGAAGCTTTGTCTGTG

                                                                                                                                                                                        This is the nucleotide sequence of cDNA clone DNA44176 (ATCC 209532) coding for human PRO347 (UNO366) (see AAY06482). The clone was isolated from a foetal kidney library. Amplification of DNA44176 occurs in various tumours, suggesting an association with tumour formation or growth. Antagonists (e.g. antibodies) directed against PRO347 may have use in cancer therapy. The invention identifies 14 genes (see AAX8724-67) that are amplified in the genome of tumour colls. Such amplification is expected to be associated with overexpression of the gene product and to contribute to tumorigenesis. The encoded proteins (see AAX06477-90) may be useful targets for the diagnosis and/or treatment (including prevention) of certain cancers, and may act as predictors of the prognosis of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                           The present invention describes nucleic acids encoding PRO secreted and transmembrane proteins used therapeutically. The PRO proteins have cytostatic, anti-inflammatory, anti-prolliferative and immunosuppressive activity. The proteins and polynucleotides can be used in therapy, identification of homologues, raising antibodies and design of probes and primers. They can be used in a range of diseases related to proteins that they have homology with, e.g. a PRO protein having homology to complement proteins may be used in inflammatory responses.

The prostation describes novel polypeptides designated PRO201, PRO292, PRO347, PRO157, PRO157, PRO10107, PRO1012, PRO10107, PRO5101.

PRO1112, PRO509, PRO883 and PRO882. These genes are amplified in the genome of tumour cells. The polypeptides are believed to contribute to tumourigenesis. The polypeptides are useful target for the identification of certain cancers, and may act as predictors of the prognosis of tumour treatment. Antibodies against these polypeptides are useful in the treatment and diagnosis of neoplastic cell growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human nucleic acids encoding secreted and transmembrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human nucleic acids encoding secreted and transmembrane polypeptides which are designated as PRO polypeptides are described. The membrane-bound proteins have various industrial applications, including as pharmaceutical and diagnostic agents. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. Anti-PRO antibodies are useful for the affinity purification of PRO from recombinant cell culture or natural sources.

This represents the coding sequence of the human T139 polypeptide. The T139 polypeptide can be expressed by standard recombinant methodology. The T139 colns insert is deposited with ATCC under accession number 98694. The T139 polypeptides and polymorlocides can be administered therapeutically or prophylactically to treat/prevent disorders associated with aberrant T139 expression or activity, especially proliferative or modulate spermatogenesis, e.g. as a contraceptive to decrease spermatogenesis or to treat disorders related to defects in sperm-egg fusion. They may also be useful to treat testicular disorders e.g. binding compounds which may be useful for detecting the polypeptides in for detecting the polypeptides in for detecting the polypeptides in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         samples; and identifying compounds modulating polypeptide activity. The polynuclectides are useful for producing probes or primers that selectively hybridize to the polynuclectides which may be useful for detecting the polynuclectides in a sample, gene mapping; identifying cells or tissues expressing aberrant T139 levels; determining if a gene max been mutated or deleted to identify subjects at risk for or having a disorder associated with T139 expression or activity and to monitor therapeutic interventions; and for producing antisense sequences for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; T139 polypeptide; immune system disorder; spermatogenesis; ss; sperm-egg fusion; testicular disorder; testicular cancer; gene mapping.

The present sequence is human protein with hydrophobic domain encoding cDNA clone HP10760. The polynucleotide and polypeptide of the invention may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The polynucleotides associated with inappropriate polypeptide express the protein. The polynucleotides and its complementary sequences may also be used as DNA probes in diagnostic assays and also used in gene therapy. The polynucleotides and its complementary sequences may also be used as DNA probes in diagnostic assays and also used in gene therapy. The polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators of polypeptide expression and activity. The polypeptides and nucleic acids may be used as nutritional complements, to modulate cytokine and cell proliferation activity, to modulate of microbial infections and autoimmune disorders such as multiple sclerosis, remunestantial autoimmune disorders such as multiple sclerosis, themmatodiate tissue growth activity (e.g. for the treatment of Parkinson's disease, Huntington's disease and Alzheimer's catement of Parkinson's disease, Huntington's disease and Alzheimer's disease, to modulate activity and inhibin activity, to modulate receptor condulate themostatic and thrombolytic activity, to modulate receptor controlling activity, to modulate haemostatic and thrombolytic activity, to modulate receptor controlling activity, to modulate inflammation and to inhibit tumour growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ij
                                                                                                                  Human proteins with hydrophobic domains and the nucleic acids encoding them, useful for preventing diagnosing and treating e.g. cancer, Alzheimer's and inflammation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

expressed by standard recombinant methodology. The T139 polypeptide can be expressed by standard recombinant methodology. The T139 cDNA insert is deposited with ATCC under accession number 98694. The T139 polypeptides and polynucleotides can be administered therapeutically or reat/prevent disorders associated with aberrant T139 expression or activity, especially proliferative or differentiative captured specially proliferative or differentiative captured specially of the immune system. They can be used to modulate spermatogenesis, e.g. as a contraceptive to decrease spermatogenesis or to treat disorders related to defects in sperma-egg fusion. They may also be useful to treat testicular disorders e.g. testicular cancer. The polypeptides may be used to identify selectively binding compounds which may be useful for detecting the polypeptides in samples; and identifying compounds modulating polypeptide activity. The polynucleotides in compounds modulating polypeptide activity. The polynucleotides in a sample, gene mapping; identifying cells or tissues expressing aberrant corresponds to a sample, gene mapping; identifying cells or tissues expressing aberrant corresponds or activity and to monitor therapeutic interventions; and for producing antisense sequences for therapeutic interventions; and for producing antisense sequences for therapeutic interventions; and for corrections and for producing antisense sequences for therapeutic interventions; and for corrections and for producing antisense sequences for therapeutic interventions; and for corrections and for producing antisense sequences for therapeutic interventions; and for producing antisense sequences for therapeutic interventions.

The invention relates to nucleic acids encoding a variety of proteins human T139 (TANGO-139), T125 (TANGO-125), T110 (TANGO-110), murine T175 (TANGO-139), T125 (TANGO-125), T110 (TANGO-110), murine T175 (TANGO-139), T125 or murine WDNM-2, having diagnostic, preventive, therapeutic and other uses. Polypeptide of the invention has the ability to modulate colotting. Polypeptide and polypeptide of the invention are useful interactions, antibodies are useful as modulating agents in regulating and treating disorder characterised by their aberrant expression or activity. The callular processes e.g. cell proliferation and/or cell differentiation. TANGO-139 is useful for treating kidney defects such as kidney failure, TANGO-135 is useful in wound healing and for treating cancer, TANGO-110, is useful for treating healing and for treating cancer, TANGO-110, is useful for treating neoplasia, TANGO-177 or WDNW-2 is useful for treating neoplasia, and tumours, and injury or trauma to the brain. TANGO-125, 110, 175 and injury or trauma to the brain. TANGO-125, 110, 175 and injury or treating cancer TANGO-139, 125, 110, 175 and injury or treating cancer TANGO-139, 125, 110 and 175 molecules are useful to treat cheart disease, cardiovascular disease, such as ischaemic heart disease. TANGO-139, 125, 110 and 175 molecules are useful to treat chronic glomerulonephritis), TANGO-175 is useful to treat uterine correct fideway) disorders, such as inflammatory diseases and dimmous. TANGO-175, or treating proliferative disorders, such as inflammatory diseases and disorders, such as inflammatory diseases and disorders, inflammatory disorders. TANGO-175, or WDNW-2 activity also include apoptotic disorders, rhementoid arthitis, inflammatory disorders, wirell munors. TANGO-175, en immune-related disorders, inflammatory disorders, viral, immune-related disorders, inflammatory disorders, viral, immune-related disorders, inflammatory disorders, viral immune related disorders, e.g., immunodeficiency disorders, viral disorders, cell growth disorders, e.g., cancers and inflammatory disorders and apoptotic disorders. The nucleic acids of the invention are used in gene therapy. The present sequence is human T139 cDNA.                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to 26 secreted human proteins. The proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases involving abnormal anglogenesis, neurodegeneration and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δŽ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length CDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as companient. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in classonsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and answers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

(I) is useful as hybridisation probes, polyymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in madical immaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences.                                                                                                                                                                                                                                                                                                             The present invention describes an isolated polypeptide comprising an immunogenic portion of an ovarian carcinoma protein (or its variants). Ovarian carcinoma proteins, and polynucleotides encoding them, have cytostatic activity and can be used in gene therapy and vaccines. Ovarian carcinoma polypeptides, nucleic acids, antibodies and vaccines are useful for the prevention, diagnosis and treatment of cancer, preferably ovarian cancer. AAA69691 to AAA70077 and AAB12552 to AAB12557 represent human ovarian carcinoma polynucleotides and proteins used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                 treatment of
